

Advantages and Disadvantages of Silicon Solar Cells

Overview

A silicon solar cell works the same way as other types of solar cells. When the sun rays fall on the silicon solar cells within the solar panels, they take the photons from the sunlight during the daylight hours. Silicon solar cells have three broad classifications based on the photovoltaic cell category present in each: 1. Monocrystalline silicon solar cells 2. Polycrystalline sil. This solar cell is also recognised as a single crystalline silicon cell. It is made of pure silicon and comes in a dark black shade. Besides, it is also space-efficient and works long. As the name suggests, this silicon solar cell is made of multiple crystalline cells. It is less efficient than the Monocrystalline cell and requires more space to accommodate. However, it is a b. This solar cell is one of the most significant thin-film variants. It can be utilised for various applications and has a high absorption capacity. It has a maximum efficiency of 13%.
