

Application scope of film capacitors

Overview

The film capacitor is a non-polarized capacitor and its dielectric is made using thin plastic films. These plastic films are sometimes metalized and are available in the market under the name “metalized capacitor”. Th. Before film capacitors came in to picture, paper capacitors were used in the decoupling circuits. Paper capacitors used impregnated paper which was placed with metal strips and r. Soon after the first film capacitor was introduced, the plastic industry saw its growth in developing thinner and more durable products. Different types of plastic film capacitors ha. As the name suggests, the film/foil capacitor uses plastic films as dielectric and is placed inside two layers of electrodes made of aluminum foil. These interleaved layers are so stru. The main difference between a film foil capacitor and a metalized capacitor is that in the latter instead of layering, the metallic electrodes are fused into either side of the plastic dielectric.
