

# How cold and hot can photovoltaic panels withstand

## Overview

Solar panels operate best at temperatures between 20°C and 25°C (68°F and 77°F), but their efficiency decreases as the temperature rises above 25°C. It is generally understood (as myth) that the hotter it gets, the better the performance and production of solar panels will be. Temperature Coefficient is Critical for Hot Climates: Solar panels with temperature coefficients of -0.30%/°C or better (like SunPower Maxeon 3 at -0.27%/°C) can significantly outperform standard panels in consistently hot climates, potentially saving thousands in lost energy production over the. How high a temperature can solar energy withstand?

1. Maintaining consistent and. This exploration will compare solar panel performance in hot and cold environments, providing insights into optimizing your system for diverse weather conditions.
