

How cold and hot can photovoltaic panels withstand

Overview

Solar panels operate best at temperatures between 20°C and 25°C (68°F and 77°F), but their efficiency decreases as the temperature rises above 25°C. It is generally understood (as myth) that the hotter it gets, the better the performance and production of solar panels will be. Temperature Coefficient is Critical for Hot Climates: Solar panels with temperature coefficients of -0.30%/°C or better (like SunPower Maxeon 3 at -0.27%/°C) can significantly outperform standard panels in consistently hot climates, potentially saving thousands in lost energy production over the.
