## Overview

The characteristics that define an EV battery performance are listed below: 1. Battery Capacity 2. C-Rate 3. Weight 4. Size 5. Power In order to understand them in detail, keep on reading the article. Battery capacity or Energy capacity is the ability of a battery to deliver a certain amount of power over a while. It is measured in kilowatt-hours (product of voltage and amp. A C-rating is used to define the rate at which a battery is fully charged or discharged. For instance, when the vehicle with an 85kWh battery is charged at a C-rate of 1C mean. The major part of an EV's weight comes from its battery. In general gross weight of a passenger EV, varies from 600kg to 2600kg with the battery weight varying from 100kg to 550kg. The size of the battery of an electric vehicle has its own significance. Energy per volume is important to building a compact EV. Volumetric energy density means an amount of energy.
