We propose a novel algorithm to infer temperature in cylindrical lithium-ion battery (LIB) systems are widely used in modern electronic devices. Their reliability and safety are of crucial importance for sustainable development and successful transition. LIB cells consist of five major parts: positive electrode (cathode), negative electrode (anode), electrolyte, separator and current collectors (Fig. 1). The two electrodes and the separator have a cross-sectional area cs_j , $j = n$ for anode, $j = p$ for cathode. A Cell cross-sectional area cs_j , $j = n$ for anode, $j = p$ for cathode. 3.1. Numerical solution of the eSPMA finite-difference method is employed to approximate the spatial derivatives in the eSPM. The simulation domain $0 \leq r \leq R_j$ is discretized with.
