

Microgrid uses 50kWh battery cabinet from a US data center

Overview

Over the last two months, a first-of-a-kind project has taken shape at an industrial site in Nevada: the world's largest microgrid built with used EV batteries, designed to power an adjacent data center. Advancements in microgrid technology are allowing data centre owners to adopt a new approach to their energy needs. Microgrids are independent networks drawing from onsite energy sources like gas turbines, fuel cells, battery storage systems, wind, or solar. They allow owners to have more control. Microgrid concepts vary, but they are essentially small-scale electrical grids, with local, behind-the-meter (BTM) power generation, management and/or storage systems that can connect to or run independently from a traditional power grid. Battery energy storage system (BESS) specialist FFD Power is deploying a customized solar-plus-storage solution for a US. A new project from battery recycling startup Redwood Materials and data center builder Crusoe shows that it's possible to build data centers cheaper and faster while also slashing emissions.
