Overview

The basic scheme of a solar thermal energy installation is as follows: These are two closed circuits with a heat exchanger. In the primary circuit, the cold heat transfer fluid passes through the solar panels. Radiation from the Sun heats it and goes to a heat exchanger to transfer thermal energy to the secondary circuit and. A solar thermal power plant is a thermal power plant whose objective is the production of electrical energy. This type of solar plant is classified. Where temperatures below about 95 °C (200 °F) are sufficient, as for space heating, flat-plate collectors of the nonconcentrating type are generally used. Because of the relatively high heat losses through the glazing, flat plate collectors will not reach temperatures much above 200 °C (400 °F) even when the heat transfer fluid is stagnant. Such temperatures are too low for.
